

ABOUT ME

Senior iOS Engineer with 10+ years shipping consumer apps used by millions, specializing in AI-integrated mobile development: production Core ML / Vision models, LLM-powered workflows, and agentic developer tooling (Claude Code, MCP). Expert in Swift, SwiftUI, UIKit, and modern architectures; proven leader of large-scale rewrites.

AI / ML

Core ML / Vision / Create ML
On-device text recognition (OCR)
Claude Code / agentic workflows
MCP (Model Context Protocol)
LLM context & memory design
Anthropic API / prompt engineering
AI workflow automation

IOS / ENGINEERING

Swift / SwiftUI / UIKit
Combine / async-await
Core Animation / Foundation
GraphQL / REST APIs
XCTest / XCUITest
MVVM / Clean Architecture
A/B Testing / Feature Flags
Accessibility (VoiceOver)
CI/CD / App Store Connect
Git / Agile / Scrum

LANGUAGES

Primary: Swift, SwiftUI, JS/TS/Node, Python, BASH
Secondary: Obj-C, C#, C++, Java

EDUCATION

Texas Tech University, 2012–2016
B.S. Computer Science, Minor in Mathematics

ASSOCIATIONS

SDC – Software Dev Club (Founding Member)
ACM – Assoc. for Computing Machinery

WORK EXPERIENCE

iHeart Radio – Senior iOS Developer — Feb 2023 – Present

- Led architecture planning and rewrite of the iHeartRadio iOS app from legacy UIKit to modern Swift and SwiftUI, significantly improving maintainability, scalability, and rendering performance.
- Pioneered AI-assisted development on the team: integrated Claude Code into daily engineering workflows with MCP servers connecting Jira/Confluence and Figma, enabling agents to work directly from tickets and design specs.
- Designed a custom context/memory scheme for AI coding agents (per-ticket context files, CLAUDE.md conventions), preserving problem history across sessions and accelerating multi-day feature work.
- Shipped playback and personalization features with Combine and async/await; delivered accessible experiences (VoiceOver, Dynamic Type) to millions of users, backed by XCTest/XCUITest suites, GraphQL data layers, and A/B experimentation infrastructure.

Fetch Package – Senior iOS Developer — Apr 2021 – Feb 2023

- Built and shipped on-device Core ML / Vision models for domain-specific text recognition, reading package-label text in real time to streamline production logistics scanning workflows.
- Developed a computer-vision verification feature recognizing apartment unit numbers from the camera feed to confirm drivers were at the correct location, reducing misdeliveries.
- Maintained and enhanced three enterprise iOS apps in UIKit and SwiftUI, shipping high-impact features, resolving critical production bugs, and evaluating emerging iOS/ML tooling for adoption.

General Motors – iOS/Mobile Developer — Jun 2016 – Apr 2021

- Built and maintained multiple production and proof-of-concept mobile apps in Swift using UIKit, Core Animation, and Foundation APIs.
- Designed scalable app architecture and intuitive user experiences within Scrum delivery and experimentation-driven product development.
- Integrated REST and GraphQL APIs, improved stability through systematic debugging, and optimized UI performance across a wide range of device targets.

Freelance – iOS Lead / Full Stack / Architect — Sep 2014 – Present

- Architect and deliver complete mobile products end-to-end for startups — from technical scoping through App Store launch — including current AI-assisted development of the Rally app via Claude Code-driven workflows.
- Manage developers, designers, and partners to ship polished apps; integrate Firebase, Parse, Supabase, and third-party SDKs. Previously co-founded Caddy Delivery, designing and building its full stack (iOS app, backend, web app, admin tools) while managing staff and daily operations.

Phunware – iOS Intern — Summer 2014

- Assisted in transitioning a codebase from Objective-C to Swift; rebuilt an in-house application in Swift.

AI ENGINEERING PROJECTS

Remote Claude Code Agent Orchestration – Creator

- Designed and built a Discord-based control plane to remotely trigger and supervise Claude Code agents across three development machines, enabling asynchronous, multi-repo AI-driven engineering.
- Integrated Atlassian and Figma MCP servers so agents pull ticket context and design specs autonomously; solved OAuth token-refresh failures in non-interactive agent sessions with a static API-token authentication layer.
- Built reusable automation routines and a per-ticket memory system giving agents durable context across sessions — practical LLM context management on real production codebases.

Self-Hosted Infrastructure Lab – Owner/Operator

- Operate a Docker-based homelab (Portainer, reverse proxying, custom domains, VPN-tunneled services) used as a testbed for automation, networking, and self-hosted AI tooling.
